MindPartner™ 2016 is a revolutionary new product for early-stage individuals with Alzheimer's disease and their caregivers. It allows users to store memories, pictures, videos, music and other parts of their life history in MIND, a "companion mind" that lives on the Cloud . MIND then feeds this information back to the person through a collection of smart apps, where each app is designed to meet a specific need or solve a particular problem. The focus of MindPartner™ is to enhance the quality of life of individuals with dementia using a combination of basic tools (such as the Communication Cards) and technology. It does not attempt to replace missing memory functions but rather use memories, in an appropriate manner, to compliment and support everyday living.

The developers at Gemini Mind Technology, Inc. have designed over 30 apps for MindPartner™ covering all stages of the Alzheimer's process. We have also added an API and SDKs to make it easy for other developers to create, what we hope will become, hundreds of additional apps that offer users a broad range of options over time. MindPartner™ 2016 starts simple with basic tools for constructing a companion mind and a collection of simple apps targeting early-stage users.

MindPartner™ 2016	**$350.00*** (Available December 2015)
